

# Menu Manager

The all new WebFeat Menu Manager is the industry's first portal manager to include single sign-on remote user authentication using WebFeat Proxy.

With Menu Manager, you can easily add and delete databases, create subject categories, even manage your subscriptions with the integrated E-Resources Vendor Management tool. Menu Manager's user interface customization tools enable you to match look and feel with your library's website, including your native links.

The WebFeat Proxy provides single sign-on authentication for remote users for your library's native database links. Users are no longer re-prompted for their barcodes every time they click a new database link. Menu Manager is pre-loaded with URLs to thousands of databases, saving you the trouble of entering them - just pick your databases and go!

Menu Manager can be used with or without WebFeat's federated search product - if your library is not ready for federated search, it can still enjoy the benefits of easy menu management and single sign-on remote authentication.
